

Pro - VIBE & Pro - VIBE DX

The work with the Vibe pedal started with a modulation circuit using transistors and ICs. Unlike photocells, these parts are not subject to usage in any conditions. In addition, we have succeeded in creating a modulation circuit that is as close to the original as possible, aiming at a juicy sound and modulation with edges like the original Uni-Vibe.

The Foot Controller is related to the original, and the Speed can be cancelled, and the Speed can be made as fast as possible to produce a sound like a ring modulator. You can also turn off the effect completely with the True Bypass SW, a preamp to compensate for the lack of volume which the originals had. There is still something to be noted. In the original mode, Chorus/Vibrato are selected by switching.

However, this device controls the degree of blending between Chorus and Vibrato to produce a subtle modulation.

Point to point hand wired. Made in JAPAN.
